Ultra Fast Response High PSRR CMOS Voltage Regulations

CJ6300E Series Low-dropout Regulators

1 Introduction

The CJ6300E series is a group of low dropout voltage linear regulators manufactured using CMOS technology. It supports the input voltage range of 1.6V to 5.5V, and can also provide current up to 500mA under the condition of good heat dissipation.

The CJ6300E series has ultra-low quiescent current and low dropout voltage, which can provide large output current even when the input and output voltage difference is very small. In addition, the CJ6300E series also features high power ripple rejection, ultralow output noise, and fast response speed. These features make the CJ6300E series very suitable for application in battery-powered devices to extend battery life, such as RF applications or other systems that require a quiet voltage source.

The CJ6300E series provides a adjustable voltage version from 0.8V to 5.0V， and the CJ6300E series can use ceramic capacitors with smaller volumes than tantalum capacitors, which can minimize the size of printed circuit boards (PCBs).

The CJ6300E series also has a built-in foldback current limiting and thermal shutdown function to help protect the regulator in the event of load short circuits or faults.

2 Applications

- Battery-powered Equipments
- Cellular and Smart Phones
- Digital Still and Video Cameras
- Laptop, Palmtops and PDA
- Portable Audio Video Equipments
- Radio Control Systems

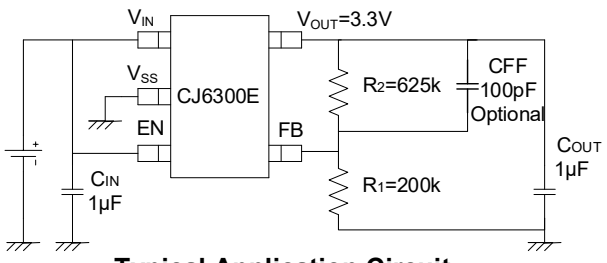

3 Features

- Input Voltage Range: 1.6V ~ 5.5V
- Adjustable Output Voltage: from 0.8V to 5.0V
- Output Tolerance: ±1%
- Output Current: up to 500mA
- Quiescent Current: 33μA (typ.)
- Dropout Voltage: 50mV@100mA
- Power Supply Rejection Ratio: 80dB@1kHz
- Output Noise Voltage: with C_{FF}=100pF
  20 × V_{OUT} μV_{RMS} (10Hz ~ 100kHz)
- Excellent Transient Response
- Anti-overshoot during Hot-swap
- Current Limit
- Fold-back Short-Circuit Protection
- Thermal shutdown protect

5.2 Pin Function

CJ6300E Series Pin Configuration			
PIN NAME	**PIN NUM.**	**I / O**	**DESCRIPTION**
IN	1	I	Input to the device. Use the recommended value of the input capacitor and place it as close to the input of the device as possible to reduce the impedance.
GND	2	-	Ground.
EN	3	I	Enable pin. Driving this pin to logic high enables the device; driving this Pin to logic low disables the device. Float this pin，disables the device.
FB	4	I	Feedback Pin (adjustable voltage version only). This is used to set the output voltage of the device.
OUT	5	O	Output of the regulator. An output capacitor is required for stability and help device obtain the best transient response. Use the capacitor with the recommended value and place it as close as possible to the output.

6 Specifications

6.1 Absolute Maximum Ratings

T_A = 25℃, unless otherwise specified(1).

CHARACTERISTIC			SYMBOL	VALUE	UNIT
Input voltage range(2)			V_{IN}	-0.3 ~ 6.5	V
Output voltage range(2)			V_{OUT}	-0.3 ~ (V_{IN} + 0.3)	V
Enable voltage range(2)			V_{EN}	-0.3 ~ (V_{IN} + 0.3)	V
Work temperature			T_{OP}	-40 ~ +125	℃
Maximum power dissipation	CJ6300E Series	SOT-23-5L	$P_{D\ Max}$	Internally Limited(3)	W
Maximum junction temperature			T_{Jmax}	150	℃
Storage temperature			T_{STG}	-40 ~ +150	℃
Soldering temperature & time			T_{SOLDER}	260℃, 10s	-

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

(2) All voltages are with respect to network ground terminal.

(3) Refer to Thermal Information for details.

6.2 Recommend Operating Conditions

PARAMETER	SYMBOL	MIN.	NOM.	MAX.	UNIT
Input voltage	V_{IN}	1.6	-	5.5	V
Operating junction temperature	T_J	-40	-	125	℃
Operating ambient temperature	T_A	-40	-	85	℃

6.3 ESD Ratings

ESD RATINGS		SYMBOL	VALUE	UNIT
Electrostatic discharge(4)	Human body model	$V_{ESD-HBM}$	3000	V

(4) ESD testing is conducted in accordance with the relevant specifications formulated by the Joint Electronic Equipment Engineering Commission (JEDEC). The human body model (HBM) electrostatic discharge test is based on the JS-001-2017 test standard, using a 100pF capacitor and discharging to each pin of the device through a resistance of 1.5kΩ.

6.4 Thermal Information

THERMAL METRIC(5)	SYMBOL	CJ6300E Series	UNIT
Junction-to-ambient thermal resistance	$R_{\Theta JA}$	**SOT-23-5L**	℃/W
		249.5	
Junction-to-case thermal resistance	$R_{\Theta JC}$	**SOT-23-5L**	℃/W
		64.8	
Reference maximum power dissipation for continuous operation	$P_{D\ Ref}$	**SOT-23-5L**	W
		0.4	

(5) Thermal metric is measured in still air with T_A = 25℃ and mounted on a 1 in^2 FR-4 substrate PCB covered with 2 ounces of copper.

7 Detail Description

7.1 Description

The CJ6300E series is a group of low dropout voltage linear regulators manufactured using CMOS technology. It supports the input voltage range of 1.6V to 5.5V, and can also provide current up to 500mA under the condition of good heat dissipation. The CJ6300E series has ultra-low quiescent current and low dropout voltage, which can provide large output current even when the input and output voltage difference is very small. In addition, the CJ6300E series also features high power ripple rejection, ultralow output noise, and fast response speed. These features make the CJ6300E series very suitable for application in battery-powered devices to extend battery life, such as RF applications or other systems that require a quiet voltage source.

The CJ6300E series provides a adjustable voltage version from 0.8V to 5.0V，and the CJ6300E series can use ceramic capacitors with smaller volumes than tantalum capacitors, which can minimize the size of printed circuit boards (PCBs). The CJ6300E series also has a built-in current limiting function to help protect the regulator in the event of load short circuits or faults.

7.2 Function Block Diagram

Enable Operation

The enable pin will turn the regulator on or off. The threshold limits are covered in the electrical characteristics table in this data sheet. If the enable function is not to be used then the pin should be connected to V_{IN}.

Short-Circuit protection

The internal Foldback Current Limitation circuitry allows the device to supply the full nominal current but protects the device against Short. Foldback is a current-limiting feature that reduces the output current as the output voltage decreases in the event of an overcurrent condition. When V_{OUT} has decreased to 0V, the current is limited to an internally set constant value. When a fault condition causing overcurrent disappears, an LDO automatically recovers from overcurrent protection, returning the output voltage to the normal level.

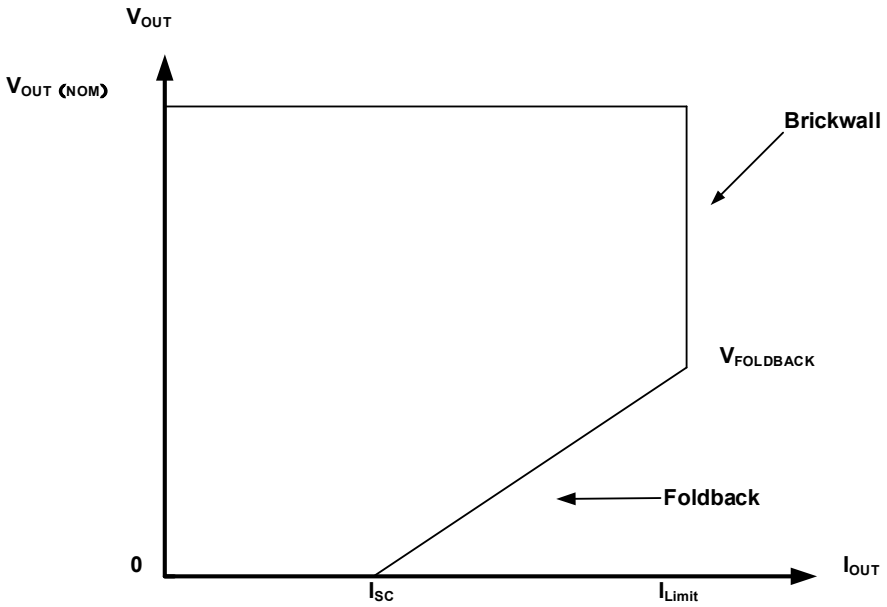

The device has an internal current limit circuit that protects the regulator during transient high-load current faults or shorting events. The current limit is a hybrid brickwall-foldback scheme. The current limit transitions from a brickwall scheme to a foldback scheme at the foldback voltage ($V_{FOLDBACK}$). In a high-load current fault with the output voltage above $V_{FOLDBACK}$, the brickwall scheme limits the output current to the current limit (I_{Limit}). When the voltage drops below $V_{FOLDBACK}$, a foldback current limit activates that scales back the current as the output voltage approaches GND. When the output is shorted, the device supplies a typical current called the shortcircuit current limit (I_{SC}). I_{Limit} and I_{SC} are listed in the Electrical Characteristics table.

The output voltage is not regulated when the device is in current limit. When a current limit event occurs, the device begins to heat up because of the increase in power dissipation. When the device is in brickwall current limit, the pass transistor dissipates power [(V_{IN} – V_{OUT}) × I_{Limit}]. When the device output is shorted and the output is below $V_{FOLDBACK}$, the pass transistor dissipates power [(V_{IN} – V_{OUT}) × I_{SC}]. If thermal shutdown is triggered, the device turns off. After the

7 Detail Description

7.2 Function Block Diagram (continue)

device cools down, the internal thermal shutdown circuit turns the device back on. If the output current fault condition continues, the device cycles between current limit and thermal shutdown.

Foldback Current Limit

Thermal Protection

Internal thermal shutdown (T_{SD}) circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When T_{SD} activated, the regulator output turns off. When cooling down under the low temperature threshold, device output is activated again. This T_{SD} feature is provided to prevent failures from accidental overheating. Activation of the thermal protection circuit indicates excessive power dissipation or inadequate heatsinking. For reliable operation, junction temperature should be limited to +150°C maximum.

8 Application and Implementation

8.1 Adjustable Output Voltage

CJ6300E has a wide range of output voltage. The output voltage is programmed by an external resistor divider as shown in Figure 1. Where V_{REF} is the internal reference voltage, which is 0.8V in CJ6300E. Choose R_2 max = 200 kΩ to maintain a 4μA minimum load. The R_2 can be calculated be by the following equation:

$R_2 = (V_{OUT} / V_{REF} - 1) \times R_1$ (Equation.1)

For most application, to ensure stability under no-load conditions，the recommended divider resistance is 40kΩ to 200kΩ ,the recommended feedforward capacitance of C_{FF} is optional ,from 10pF to 4.7nF.

Resistors R_1 should be used with values in the range from 40kΩ to 1000kΩ. Lower values increase current consumption, $R_1 \geq 40k\Omega$.

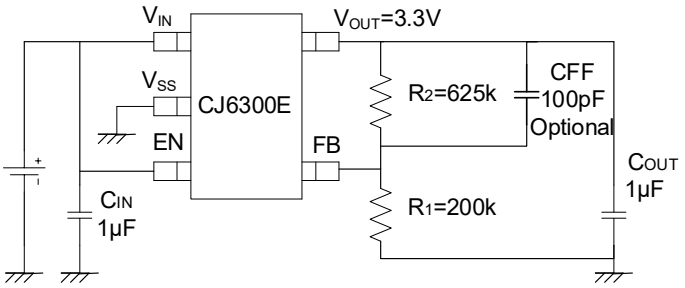

Figure 1

R_1 (Ω)	R_2 (Ω)	V_{OUT} (V)	$IR_1 = 0.8 / R_1$(μA)
40k	125k	3.3	20
100k	312.5k	3.3	8
200k	625k	3.3	4
1M	3.125M	3.3	0.8

8.2 Feed-Forward Capacitor (C_{FF})

For the adjustable-voltage version device, a feed-forward capacitor (C_{FF}) can be connected from the OUT pin to the FB pin. C_{FF} improves transient, noise, and PSRR performance, but is not required for regulator stability.

Recommended C_{FF} values are listed in the Recommended Operating Conditions table. A higher capacitance C_{FF} can be used; however, the startup time increases.

8.3 Input and Output Capacitors

For the CJ6300E series, it is recommended to use 1μF input C_{IN} and output C_{OUT} ceramic capacitors. It is recommended to use a 1μF capacitor at the input & Output pin of the device separately, and the position of the capacitor should be as close to the device pin as possible. Since any leakage of the capacitor will increase the quiescent power consumption of the whole circuit, attention should be paid to selecting capacitors with low leakage. When designing the circuit of portable equipment including CJ6300E series, due to the shortage of tantalum capacitors, it is a good choice to use small size, low equivalent series resistance (ESR) and high RMS current capacity multilayer ceramic capacitors (MLCC) in the DC to DC voltage conversion. The designer must choose the appropriate capacitor type for circuit design: X7R- Ceramic capacitors of X5R- and COG- rated dielectric materials can provide relatively good capacitance stability within the temperature range, Y5V- type capacitors are not recommended because of large changes in capacitance values. However, no matter which type of ceramic capacitor is selected, the effective capacitance may vary with the operating voltage and temperature. The designer must consider the influence of the change of the effective value of capacitance according to the circuit design and application conditions.

8 Application and Implementation

8.4 Dropout Voltage

Dropout voltage (V_{DO}) refers to the minimum voltage difference between input and output (V_{IN} - V_{OUT}) to make the device output voltage reach the rated range at rated current. When the dropout voltage condition required by the device is reached, the internal MOSFET will be fully turned on, at this time, the MOSFET is equivalent to a switch for regulation. The V_{DO} increases with the increase of load current. Since V_{IN} - V_{OUT} must be no less than the V_{DO}, the V_{DO} indirectly specifies the minimum input voltage of devices under different load current conditions. If the V_{IN} - V_{OUT} is less than the V_{DO}, the performance of the device may deteriorate (see *Operation in Dropout Mode* for details).

8.5 Operation in Dropout Mode

The CJ6300E series is internally integrated with a P-MOSFET to achieve low dropout voltage. The voltage difference between the input and the output V_{IN} - V_{OUT} of the device must not be lower than the corresponding dropout voltage V_{DO} to ensure that the output voltage tolerance is within the rated range of the data sheet. The dropout voltage will increase with the increase of load current. When the V_{IN} - V_{OUT} is less than the V_{DO}, the P-MOSFET inside the device is in a linear state, the resistance from the input pin to the output pin is equal to the resistance from the drain to the source of the P-MOSFET, and the device functions like a resistor. When operating in this state, the response time of the error amplifier inside the device will be limited, which will seriously degrade the transient performance of the device, when the external circuit has a transient change, the deviation of the output voltage will become larger than the normal operating state. In addition, the PSRR and noise performance of the device will be worse than that under normal operating conditions.

8.6 Transient Response

Transient response refers to the change of system output from initial state to stable state under the action of typical signal input. For LDO, the designer should pay attention to the possible impact of linear transient response and load transient response on the system: linear transient response refers to the transient response of output to change when the input voltage changes, while load transient response refers to the transient response of output to change when the output current changes. The specific phenomenon is that the output voltage of the device will have a short spike, especially when the input voltage or output current changes greatly in a short time. This change is not only related to the performance of the chip itself, but also related to the change of output current, change rate and output capacitance:

1. When the output current increases, the output voltage of the device will decrease to a certain extent, and the larger output current will provide a higher current discharge path for the output capacitor, which will affect the peak value generated by the transient spike and reduce the peak value;
2. The output current or input voltage changes relatively slowly, and the output change of the device is relatively small, affecting the spike caused by the change;
3. The use of large input and output capacitors can reduce the spike caused by transient response to a certain extent to improve the transient performance, but large output capacitors can also affect the response time of devices.

8.7 Recommended Continuous Operating Areas

As an LDO, the working area of CJ6300E series is limited by dropout voltage, output current, junction temperature and input voltage under continuous working condition. The recommended areas for continuous operation are shown in Figure 8-1:

A. The LDO input and output voltage difference V_{IN} - V_{OUT} must meet the dropout voltage V_{DO} conditions. See *Dropout Voltage* for more details.
B. Rated output current range I_{Rated}.
C. The actual junction temperature T_J of LDO shall not exceed the rated junction temperature. The product of voltage difference and current at both ends of LDO is power consumption, which determines the actual working junction temperature of LDO, so the curve is not linear.

In addition, the working area of CJ6300E series is limited by the rated V_{INMIN} and V_{INMAX}.

8 Application and Implementation

8.7 Recommended Continuous Operating Areas (continue)

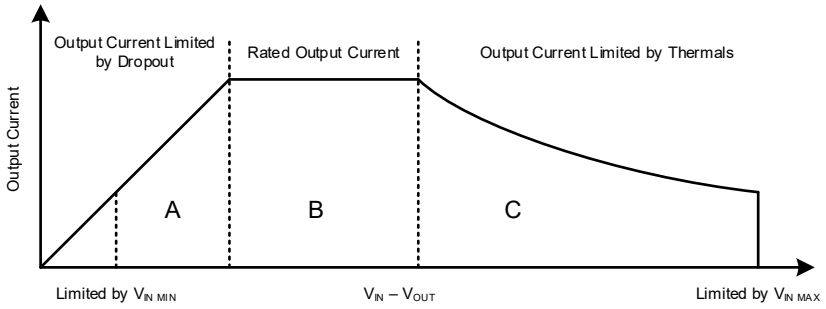

Figure 8-1. Recommended areas for continuous operation

8.8 Power Supply Recommendation

The CJ6300E series is designed to operate within the input power supply voltage range of 1.6V to 5.5V. The input power supply should be well adjusted and have low noise. If the input power supply has high noise, it is recommended to use an additional bypass capacitor at the input to improve the output noise performance of the device. It is recommended to use an input capacitor of 1μF or higher to reduce the impedance of the input power supply, especially during transients.

8.9 Layout Guidelines

When designing the circuit including CJ6300E series, the following matters should be noted:

- Place the input and output capacitors as close to the pins of the device as possible;
- The device is connected by copper plane and the heat sink (or back pad) of the device is fully welded with PCB to obtain better heat dissipation performance and lower on resistance;
- Heat sink holes are placed around the device to help the circuit dissipate more heat energy. However, attention should be paid to the position of the heat sink holes to prevent the solder (or solder paste) on the IC pad from being absorbed by the heat sink holes and being damaged during welding.

8.10 Thermal Consideration

The junction temperature can be determined using the junction-to-ambient thermal resistance ($R_{\theta JA}$) and the total power dissipation (P_D). Use Equation.2 to calculate the power dissipation. Multiply P_D by $R_{\theta JA}$ as Equation.3 shows and add the ambient temperature (T_A) to calculate the junction temperature (T_J).

$$P_D = (I_{GND} + I_{OUT}) \times (V_{IN} - V_{OUT}) \quad \text{(Equation.2)}$$

$$T_J = R_{\theta JA} \times P_D + T_A \quad \text{(Equation.3)}$$

Calculate the maximum ambient temperature as Equation.4 shows if the ($T_{J(MAX)}$) value does not exceed 125°C. Equation.5 calculates the maximum ambient temperature with a value of 62.6°C.

$$T_{A(MAX)} = T_{J(MAX)} - R_{\theta JA} \times P_D \quad \text{(Equation.4)}$$

$$T_{A(MAX)} = 125°C - 249.5°C/W \times (3.8\ V - 3.3\ V) \times (0.5\ A) = 62.6°C \quad \text{(Equation.5)}$$

NOTE

The application information in this section is not part of the data sheet component specification, and SZCJ makes no commitment or statement to guarantee its accuracy or completeness. Customers are responsible for determining the rationality of corresponding components in their circuit design and making tests and verifications to ensure the normal realization of their circuit design.

9 Notes and Revision History

9.1 Associated Product Family and Others

To view other products of the same type or IC products of other types, click the official website of SZCJ -- **http://www.szcjsemi.com** for more details.

9.2 Notes

Electrostatic Discharge Caution

This IC may be damaged by ESD. Relevant personnel shall comply with correct installation and use specifications to avoid ESD damage to the IC. If appropriate measures are not taken to prevent ESD damage, the hazards caused by ESD include but are not limited to degradation of integrated circuit performance or complete damage of integrated circuit. For some precision integrated circuits, a very small parameter change may cause the whole device to be inconsistent with its published specifications.

9.3 Revision History

January , 2026: released CJ6300E series rev - 1.0.

10 Orderable, Mechanical, and Packaging Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser based versions of this data sheet, refer to the left hand navigation.

Orderable Information

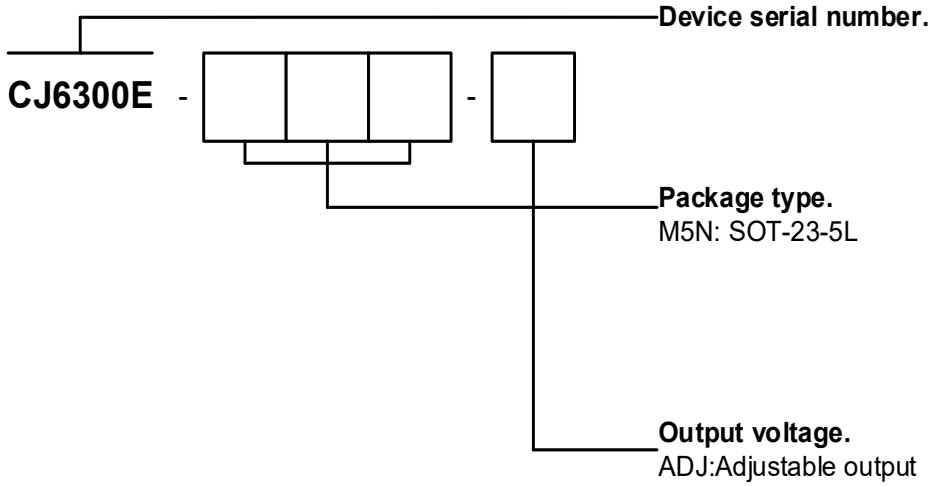

Figure a. Naming Conventions

MODEL	DEVICE	PACKAGE	OP TEMP	ECO PLAN	MSL	PACKING OPTION	SORT
Pins Packaged Products							
CJ6300E	CJ6300E-M5N-ADJ	SOT-23-5L	-40~85°C	RoHS&Green	Level3 168HR	Tape and Reel 3000Units/Reel	Active

Note:

ECO PLAN: For the RoHS and Green certification standards of this product, please refer to the official report provided by SZCJ.

MSL: Moisture Sensitivity Level. Determined according to JEDEC industry standard classification.

SORT: Specifically defined as follows:

Active: Recommended for new products;

Customized: Products manufactured to meet the specific needs of customers;

Preview: The device has been released and has not been fully mass produced. The sample may or may not be available;

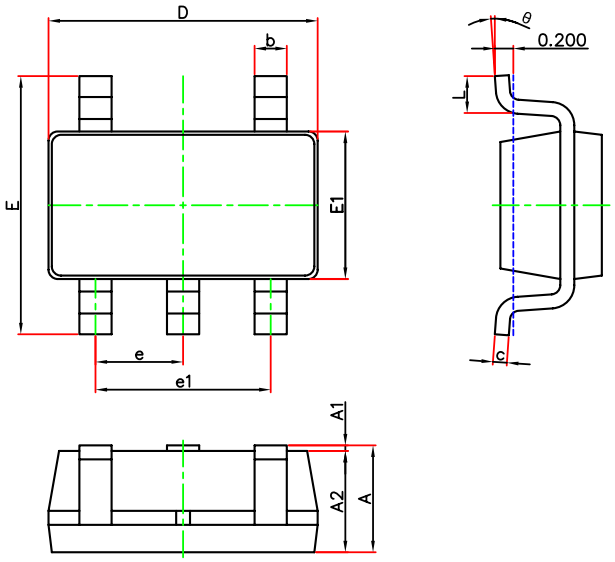

NoRD: It is not recommended to use the device for new design. The device is only produced for the needs of existing customers;

Obsolete: The device has been discontinued.

1. Controlling dimension: in millimeters.
2. General tolerance: ±0.05mm.
3. The pad layout is for reference purpose only.

Packaging Information

SOT-23-5L Tape and Reel Information

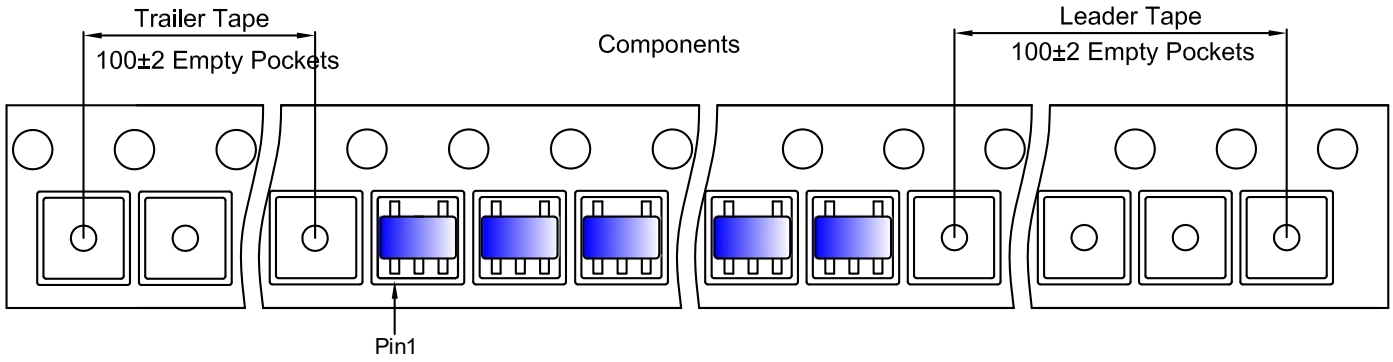

SOT-23-5L Embossed Carrier Tape

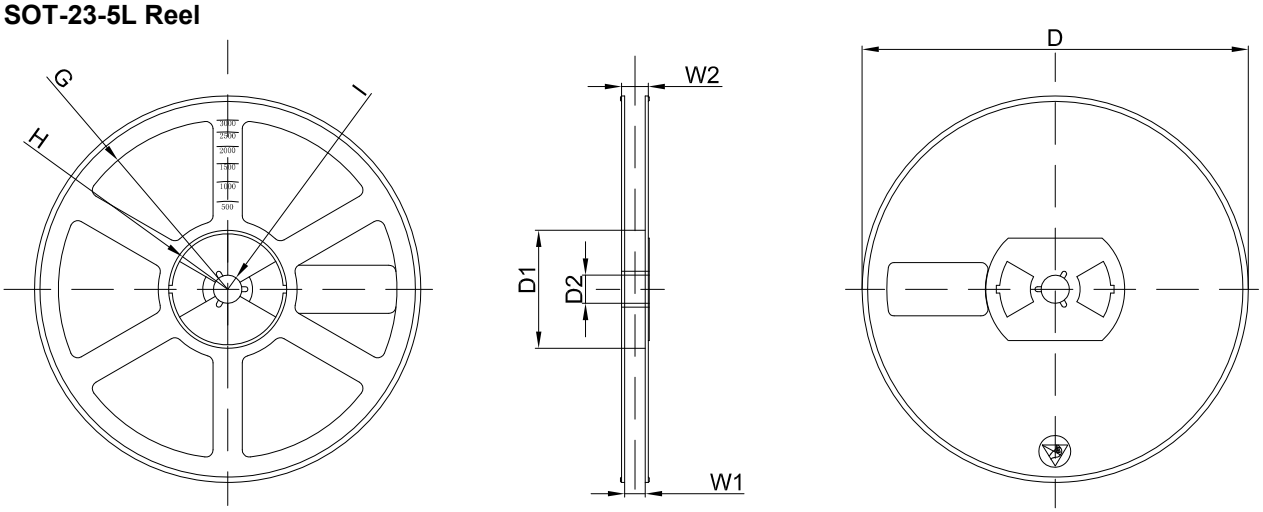

Packaging Description:
SOT-23-5L parts are shipped in tape. The carrier tape is made from a dissipative (carbon filled) polycarbonate resin. The cover tape is a multilayer film (Heat Activated Adhesive in nature) primarily composed of polyester film, adhesive layer, sealant, and anti-static sprayed agent. These reeled parts in standard option are shipped with 3,000 units per 7″ or 18.0cm diameter reel. These reels are clear in color and is made of polystyrene plastic (anti-static coated).

Dimensions are in millimeter										
Pkg type	a	B	C	d	E	F	P0	P	P1	W

REEL	Reel Size	Box	Box size (mm)	Carton	Carton size (mm)	G.W.(kg)
3,000 pcs	7 inch	30,000 pcs	203×203×195	120,000 pcs	438×438×220	

DISCLAIMER

IMPORTANT NOTICE, PLEASE READ CAREFULLY

The information in this data sheet is intended to describe the operation and characteristics of our products. SZCJ has the right to make any modification, enhancement, improvement, correction or other changes to any content in this data sheet, including but not limited to specification parameters, circuit design and application information, without prior notice.

Any person who purchases or uses SZCJ products for design shall: 1. Select products suitable for circuit application and design; 2. Design, verify and test the rationality of circuit design; 3. Procedures to ensure that the design complies with relevant laws and regulations and the requirements of such laws and regulations. SZCJ makes no warranty or representation as to the accuracy or completeness of the information contained in this data sheet and assumes no responsibility for the application or use of any of the products described in this data sheet.

Without the written consent of SZCJ , this product shall not be used in occasions requiring high quality or high reliability, including but not limited to the following occasions: medical equipment, military facilities and aerospace. SZCJ shall not be responsible for casualties or property losses caused by abnormal use or application of this product.
